

Top1Movers Operations Portal

Workflow guide and mockup testing guide

Prepared for Marlo and Levi | 29 September 2026 | Read time about 15 minutes

Read this first

- We are building a **logistics system**: one place to follow a client's imported shipment from the first inquiry until we have billed the client, so nobody has to dig through folders and email.
- What exists today is a **mockup**: a working demo with made-up data. Nothing is saved and nothing is connected to real systems.
- We have written **183 test cases** to check that the mockup behaves the way it should. We need your help running them.
- You do **not** need any logistics background. Section 2 explains the words, and every test case says exactly what to click and what to expect.

What is in this guide

Part	What it answers
1. The big picture	What are we building, for whom, and why?
2. Logistics words in plain English	What do BL, customs lodging, POD, detention and the other terms mean?
3. How a shipment moves (the workflow)	The steps from inquiry to closed job, and the rules the system enforces.
4. Who uses the system	Six kinds of user, what each sees and what each may do.
5. Handling the client's money	The funds notebook, charges, surprise costs and the handoff to Finance.
6. What the mockup is, and is not	Limits, assumptions and questions still open.
7. The test cases	What the workbook is, how to use it, who tests what, how to report a problem.

1. The big picture

Who is the client? Top1Movers Worldwide Inc. is a Philippine company that helps businesses bring goods in from other countries. Think of the goods as a big steel container that sails from a foreign port (for example Shanghai) to Manila. Before the client can use those goods, somebody must handle the paperwork with customs, pay the government duties, arrange a truck, deliver the container, and then bill the client. That somebody is Top1Movers.

What is the problem? Today this work is tracked in scattered folders, spreadsheets and email. It is hard to answer simple questions such as: *Where is this shipment right now? Which document is missing? Who is late? Did we already bill for that fee?*

What are we building? A web portal where every shipment has one record, called a **Shipment Job**. Everything hangs off that job: its status, tasks, documents, problems, delivery proof and money. If you have ever watched a Shopee parcel move from "Packed" to "Out for delivery" to "Delivered", it is the same idea, but for the company's internal work, with much more detail behind each step.

What makes it useful? The focus is **visibility**. The portal shows at a glance where each shipment is, what is stuck, and what will cost money if nobody acts (for example, port storage fees that start after a few free days). Clients can also check their own shipment on a public tracking page, with no account.

Why a mockup first? The mockup lets the client see and click through the idea before any real system is built. Testing it now catches wrong wording, confusing screens and broken rules while they are cheap to fix.

The 11 areas of the system

Area	In plain words
Customers	The companies Top1Movers works for, their contacts, delivery addresses and special instructions. Warns about duplicates.
Inquiries and Quotations	A client asks for a price, we send a quotation (kept in versions v1, v2, v3), and the client signs it to accept (called <i>conforme</i>). The approved quote turns into a Shipment Job without retyping.
Shipment Jobs	The main record. A 360 view of one shipment: stage, tasks, documents, problems, delivery and money.
Tasks and milestones	The to-do list attached to each job, with an owner and due date. Some tasks need proof (a file) before they can be marked done. Late tasks are flagged.
Documents	The paperwork checklist for each job. Upload, review, approve or reject with a reason, replace.
Exceptions and approvals	When something goes wrong (wrong paperwork, customs hold, damage), a manager reviews it, assigns a fix, and the job is paused until then.
Delivery and proof of delivery	Confirming the goods arrived, who received them, a photo or file as proof, and any damage.
Charges and billing readiness	The money side: what the client sent us, what we paid for them, our own fees, and whether the job is ready to hand to Finance.
Dashboard and reports	Managers see overdue tasks, missing documents, open problems, jobs short on funds, and billing-ready jobs.
Users and roles	Who can log in and what each person may see or do.
Audit trail	A history of who did what and when. Filterable by date.

2. Logistics words in plain English

You will see these words on screen and in the test cases. You do not need to memorise them; come back to this page whenever a word is unfamiliar.

Word	What it means
Shipment Job	One customer's shipment tracked as a single record, with a code like SJ-2026-00101.
Container	The big steel box the goods travel in. It has an ID such as TMWU-330218-4.
Consignee	The person or company that receives the goods at the end.
Bill of Lading (BL)	The main transport paper from the shipping line. It proves the goods were shipped and who they belong to.
Shipping line and vessel	The company that owns the ship (for example Maersk), and the specific ship and trip (vessel and voyage number).
Port of entry	The Philippine port where the ship arrives, such as Manila.
Customs	The government office that checks imports and collects taxes before goods may leave the port.
Customs broker	A licensed professional who does the customs paperwork for the importer. This is Top1Movers' core service.
Lodging	Filing the customs entry (the official declaration of what is being imported).
Assessment	Customs works out how much duty and tax is owed.
Duties and taxes	The money paid to the government to bring the goods in. Top1Movers usually pays first and bills the client back.
Release	Customs and the port say the goods may leave. Nothing can be trucked out before this.
Delivery order	A paper from the shipping line that lets the trucker collect the container.
Customs lane: Green, Yellow, Red	How closely customs checks the shipment. Green is a light check, Yellow is a document check, Red is a physical inspection, which takes longer.
Free storage days	A few days when the container may sit at the port for free. After that the port charges a fee every day.
Detention	A similar countdown for the shipping line's empty container. Return it late and the line charges a fee.
Proof of delivery (POD)	A signed paper or photo showing the goods were received.
Conforme	The client's signed acceptance of a quotation.
Exception	Anything that goes off plan and needs a decision: wrong paperwork, a customs hold, damage, delay.
Reimbursable cost	Money Top1Movers pays on the client's behalf (duties, freight, port fees) and is repaid for.
Service fee	Top1Movers' own charge for its work. This is the company's income.
Billing ready	Everything is complete and checked, so the job can be handed to Finance.

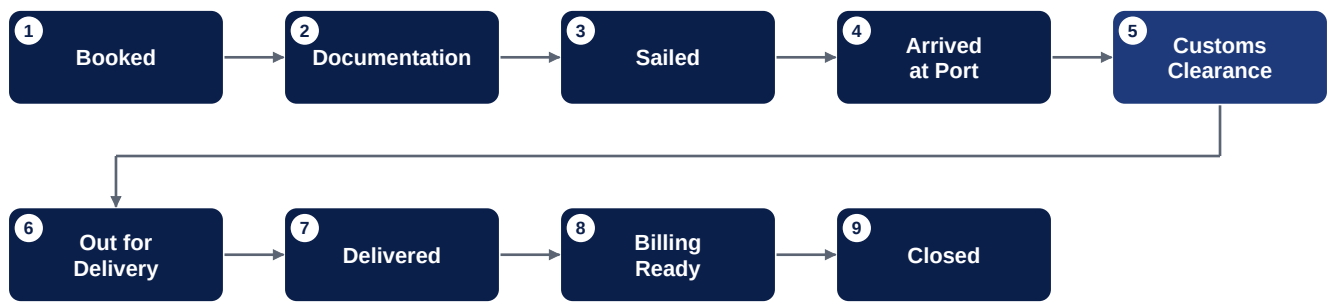

3. How a shipment moves (the workflow)

A shipment's life has two halves: first the **commercial half** (winning the work), then the **operations half** (doing the work).

Part A: winning the work

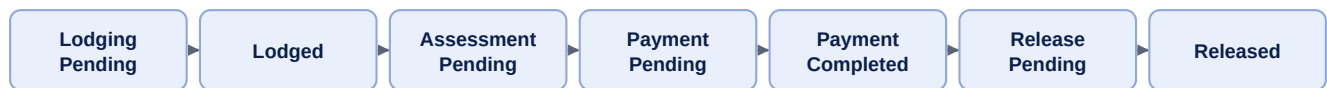

Step	What happens	Who
1. Inquiry	A client asks for a price. The inquiry is registered and checked for missing information (origin, cargo, destination).	Dispatcher
2. Quotation	A quotation is created. If the client asks for changes it becomes v2, v3 and so on. Older versions are kept.	Dispatcher
3. Conforme	The client's approval is recorded (who approved, when, by what method).	Dispatcher
4. Convert to Shipment Job	One click creates the job. All details carry over from the inquiry and quotation with no retyping. The five required documents appear as "Missing".	Dispatcher

Part B: doing the work. The nine stages of a job

#	Stage	What is going on	Who mainly acts
1	Booked	The job exists. Documents are still missing.	Dispatcher
2	Documentation	Collect and check the five documents: Commercial Invoice, Packing List, Bill of Lading, Certificate of Origin, Import Permit. Each is approved or rejected with a reason.	Dispatcher
3	Sailed	The ship has left. The client sees "On the water".	Dispatcher
4	Arrived at Port	The ship reached Manila. The free storage clock is now the thing to watch.	Dispatcher
5	Customs Clearance	The longest and riskiest stage. Broken into seven smaller steps, shown below.	Dispatcher, Manager
6	Out for Delivery	Customs released the goods, a truck is booked and the container is on its way to the client.	Dispatcher, Warehouse Crew
7	Delivered	Reached by confirming delivery with proof (receiver name and a file). Damage can be reported. The empty container must then be returned, before detention fees start.	Warehouse Crew
8	Billing Ready	Money is checked and the job is handed to Finance.	Manager
9	Closed	Nothing left to do.	Manager

Inside stage 5: the seven customs steps

At **Payment Pending** the system asks who the job is waiting on: Top1Movers or the client. That way, when a shipment is stuck, everyone can see *whose* move it is.

Rules the system enforces

These rules are the heart of the mockup. Many test cases check that the system says "no" at the right moment.

Rule	What you will see
No skipping ahead	A job can only move to the next stage. Trying to jump is refused, with a message.
Proof before done	Some tasks (for example Lodge customs entry, Pay duties) cannot be completed without attaching a file. The message reads "Attach the completion evidence first."
Delivered needs proof	A job cannot become Delivered from the stage list. Delivery has to be confirmed with proof of delivery.
A problem pauses the job	When an exception is raised, the job goes on hold and its stage cannot be changed until a Manager or Admin reviews it and assigns a corrective task.
Rejecting needs a reason	A document cannot be rejected without saying why.
Billing checklist	A job can only be marked Ready for Finance when all six checklist lines are done: all milestones complete, all documents approved, delivery confirmed with proof (and no damage reported), no open exceptions, extra charges resolved, and at least one charge recorded.
Manager override	Real jobs are not always in perfect order (for example, customs filing can start before the ship arrives). A Manager or Admin can force an out-of-order change, but must give a reason, which is logged.
Customs lane and hold	Only a Manager or Admin can set the lane (Green, Yellow, Red) or place and clear a customs hold.

Deadline clocks

Two countdowns are shown as warning chips on the job list and the job page: **free storage days left** at the port and **free detention days left** on the container. When the days run low, or run out, the job is flagged. This is one of the main selling points: the portal warns you *before* the fees start.

Where the customer comes in

The client can open a public **tracking page** without logging in and type a job number. They see a friendly headline ("On the water", "Arrived at port", "Delivered"), a timeline, and where relevant a short "Action needed from you" note. They never see internal details such as exceptions, money or staff names.

4. Who uses the system

There are five staff roles plus the outside customer. Each person sees **only** what their job needs. Menus that a role may not use are not shown at all (not greyed out). The permission rules are one of the most important things to test. Dispatcher and Warehouse Crew work in a simple, touch-friendly **field view** (a "My Tasks" page grouped by urgency, made for people on the move); Manager, Admin and Finance use the **full portal** with sidebar, dashboard, job list and audit trail.

Role (demo person)	Lands on	In short
Dispatcher (Ana Cruz, Cathy Lim)	My Tasks	Runs the customer's work: customers, inquiries, quotations, jobs, documents, tasks, stage updates. Sees the dashboard for their own customers only. Cannot see money.
Warehouse Crew (Ben Santos, Rico Domingo)	My Tasks	Field work on phone or tablet. Sees only the jobs assigned to them. Completes their tasks, uploads documents, confirms delivery with proof, can raise an exception.
Manager (Grace Tan)	Dashboard	Oversight. Approves exceptions, controls customs lane and holds, overrides stages, manages the client's money, marks jobs Ready for Finance and closes them.
Admin (Mark Villar)	Dashboard	Everything a Manager can do, plus adding people, turning accounts on or off and reading the permission table.
Finance (Paolo Reyes)	Dashboard	Read only. Sees jobs, charges, the client funds notebook, the Billing Summary and the audit trail. Cannot change anything.
Customer (no account)	Public tracking page	Sees shipment status only.

Who can do what (simplified; the full table is on the Permission Matrix sheet)

Area	Dispatcher	Warehouse Crew	Manager	Admin	Finance
Dashboard	Own customers	No	All jobs	All jobs	All jobs
Customers, inquiries, quotations	Yes	No	Yes	Yes	No
Shipment jobs	All jobs	Assigned only	All	All	Read only
Tasks	Complete, reassign	Own only	Complete, reassign	Complete, reassign	No
Documents	Upload, approve, reject	Upload only	Full	Full	No
Exceptions	Raise	Raise	Raise, approve	Raise, approve	No
Delivery and proof	No	Yes	Yes	Yes	No
Customs lane, hold, stage override	No	No	Yes	Yes	No
Charges, funds, margin	Hidden	Hidden	Full	Full	View only
Billing Summary	No	No	Yes	Yes	Yes
Users and roles	No	No	No	Yes	No
Audit trail	No	No	Yes	Yes	Yes

5. Handling the client's money

The situation. To get a shipment out of the port, Top1Movers has to pay other parties first: the government for duties, the shipping line for freight, the port for fees. Then it bills the client back. It is like a personal shopper who pays for a friend's order and asks to be repaid. With many clients at once, it is easy to lose track of who paid what.

The solution: a money notebook for every job. It sits on the job's Charges tab, using plain wording:

Line	Meaning
Money in	What the client has sent us (deposits), with proof.
Money spent	What we paid on the client's behalf (each payment should have a receipt).
Left over	Money in minus money spent.
Final balance	One clear sentence: Refund due to client , Balance to bill client or Fully settled .

What the notebook does for you

- **Two kinds of charge.** *Reimbursable* (pass-through costs like duties and freight) and *Service fee* (Top1Movers' own income). Margin is calculated from our own fees and markup, not from pass-through costs, so it is not overstated. The screen explains how it is worked out.
- **Funding-gap warning.** If a bill is due soon and the money on hand does not cover it, an amber banner explains the shortfall in plain words (for example "Duties of PHP 18,400 due 30 Sep. Funds on hand cover PHP 10,000. Short by PHP 8,400.") and mentions the storage-fee consequence. The dashboard also lists jobs that are short on funds.
- **Receipt missing.** A payment with no receipt attached is flagged.
- **Surprise charge check.** A charge that was not in the approved quotation is flagged "Not in quotation". A Manager must either record that the client approved it, or absorb the cost with a written reason. Until then the job cannot be handed to Finance.
- **Cost and margin.** Quoted amount versus actual, with a warning when costs reach the quote.
- **Billing Summary.** A printable page for the handoff to Finance. It is labelled "Mock document" and is **not** an invoice.

The five money scenarios built into the sample data

Sample job	Situation
SJ-2026-00060	Fully funded. A refund is due to the client (PHP 16,100).
SJ-2026-00101	Client sent too little. Balance to bill the client (PHP 13,900). Has a real sample PDF.
SJ-2026-00050	Money in exactly covers everything. Fully settled.
SJ-2026-00070	A surprise storage fee and a payment with no receipt. Refund is provisional until resolved.
SJ-2026-00120	Short on funds: duty due 30 Sep, PHP 8,400 short, storage fees start in 2 days.

What this is not. It is not accounting software. There is no general ledger, no tax or VAT calculation, no payment gateway and no bank link. It is a per-job notebook that makes the handoff to Finance cleaner. Real bookkeeping stays in whichever accounting system the client already uses.

6. What the mockup is, and is not

The mockup is a single file (apps/mockup/index.html) that opens in a browser by double-clicking. To keep testing fair and repeatable, please keep these facts in mind:

Fact	What it means for you
All data is made up	Every name, ID, amount and file is fictional.
Nothing is saved	Everything lives in the open page. Refresh (F5) to restore the original sample data, then sign in again.
The date is frozen	The mockup's "today" is Monday 28 September 2026 . All overdue and days-left statements assume this. Ignore your computer's date.
Files are pretend	Uploads keep only the file name. Buttons like Open or View show a message instead of a real file. The one exception is the sample PDF for job SJ-2026-00101.
No real email or accounts	Overdue emails are an illustration and nothing is sent. Sign-in is simulated: click "Sign in with Microsoft" and pick a person.
Best browser	Chrome or Edge on a laptop screen. A few cases check tablet and phone widths.

Assumptions we are still checking

The workflow in this guide follows the client's written blueprint and general Philippine customs-brokerage practice. It has **not yet been confirmed line by line with Top1Movers' real operations**. Extras we added on top of the blueprint (deadline clocks, the ocean stages before customs, customs lane and hold, the funds notebook) should be confirmed with the client in the discovery weeks. If, while testing, something does not match how you think shipping really works, write it down; that is valuable feedback, not a mistake.

Questions the team still needs to decide

The workbook's **Known Limitations** sheet lists things that are deliberately unfinished. Do not log these as defects. The ones that need a decision:

- Should a Dispatcher see **every** job in the list, or only their own customers' jobs? (Today: every job; only the dashboard is limited.)
- Who exactly may advance a job's stage? (Today: any role that can open the job, except Finance.)
- What is the process after a delivery with damage? (Today there is no "resolved" step, so billing stays blocked.)
- The pre-built sample PDF still calculates margin the older way and has "invoice" in its file name. It should be regenerated.
- The customer tracking page uses a guessable job number. A real system would use a secure expiring link.

7. The test cases

A note on the name. The workbook is called **UAT-test-cases.xlsx**, and "UAT" normally means user acceptance testing by the real client. Here it is really **mockup test cases**: a checklist to confirm the mockup works as designed before we show it. Please read "UAT" as "mockup test".

The idea. Each test case is one small scenario: *as this person, do these steps, and you should see this result*. If what you see matches, mark it Pass. If anything differs, mark it Fail and log it. You do not need to understand logistics to do this; you only need to follow the steps and compare.

What is inside the workbook

Sheet	What it is for
Read me	Instructions, status meanings and a sign-off table.
Summary	Live progress by role, case type and journey, plus defect counts. It fills itself in; do not type here.
Test Cases	183 cases, one per row. Filter by Role or Area, then work down the list.
E2E Journeys	6 end-to-end stories with several people, 38 steps in total.
Defects	Where every failure is logged, with severity and status dropdowns.
Test Data	The demo people, the 12 sample shipments and the key numbers to compare against.
Permission Matrix	What each role may do. Use it for Access cases.
Coverage	Which cases test which feature.
Known Limitations	Things that are deliberately unfinished. Not defects.

The four kinds of case

Type	Count	Meaning
Happy	98	The normal path works.
Wrong	47	Something goes wrong (missing item, bad input, blocked action) and the system must cope politely.
Access	24	A role must be able to do, or be blocked from, something.
Edge	14	Unusual but valid situations.

The cases are arranged by point of view: Everyone 13, Dispatcher 51, Warehouse Crew 19, Manager 34, Admin 16, Finance 19, Customer 14, Cross-cutting 9, Data check 8.

How to run a test case

Step	What to do
1	Open apps/mockup/index.html in Chrome or Edge. Press F5 to start from fresh data.
2	Click Sign in with Microsoft , then pick the person named at the top of the section (for example Dispatcher, Ana Cruz).
3	In the Test Cases sheet, filter by your Role. Work down the list in order . Cases in a section are built to run one after another on the same page load unless they say <i>Refresh first</i> .
4	Do the numbered Steps . Names in bold are buttons or tabs exactly as written on screen.
5	Compare what you see with the Expected result . Every part must be true to pass.
6	Fill the yellow cells: Status , Tester (your name), Date tested , and Notes if useful. Leave other cells alone.
7	If it failed, add a row in the Defects sheet (what you saw, and a screenshot) and put its ID, such as D-001, in the case's Defect ID cell.

Choosing a status

Status	Use it when
Pass	Every part of the expected result is true.
Fail	Any part is different.
Blocked	You could not run it, for example an earlier case left the data in the wrong state. Refresh and retry first.
Not run	The starting value. Leave it until you try the case.

How serious is a defect?

Severity	Meaning	Example
Critical	A role sees or does what it must not, or the page breaks.	Warehouse Crew can open the Audit Trail.
Major	A feature gives a wrong result.	The refund amount is calculated wrongly.
Minor	Wording, layout or polish.	A label is cut off on a phone.

A finished row looks like this: **DSP-35 | Fail | Maria Santos | 29 Sep 2026 | D-004 |** "Task completed with no file; expected the message Attach the completion evidence first."

Tips for testers without logistics experience

- Do not guess. If a step is unclear, ask, and note the confusing wording. **Confusing wording is a finding.**
- Trust the expected result, not your instinct. The expected results were checked against this build with an automated walkthrough of over 300 checks that all passed, so a difference is very likely a real finding.
- If the screen is right but the *expected result* looks wrong, note that too.
- Use the Notes column freely for "this felt slow", "I did not know what this button does" and similar.

Who tests what

The plan estimates how long each part takes. Here is a suggested way to split it between the three of us; we can adjust it together.

Part	Cases	Time	Suggested owner
Everyone: sign-in, access, search	13	about 20 min	Anyone
Dispatcher's view	51	60 to 75 min	Person 1
Warehouse Crew's view	19	40 to 50 min	Person 1
Manager's view (includes the money notebook)	34	75 to 90 min	Person 2
Admin's view	16	45 to 60 min	Person 2
Finance's view	19	45 to 60 min	Person 3
Customer tracking page (best done by someone outside the project)	14	15 to 20 min	Person 3
Cross-cutting and data checks	17	about 20 min	Anyone
End-to-end journeys (one person per role, together)	38 steps	90 to 120 min	All three, in one sitting

Run your own role first, then do the end-to-end journeys together. Journeys pass work from one role to the next (for example, the Dispatcher sets up a job, the Warehouse Crew confirms delivery, the Manager settles the money, Finance reads the summary), so each person plays their role in turn.

The six end-to-end journeys

Journey	The story
E2E-01	The happy path: from first inquiry to money settled, with the customer watching the tracking page (13 steps).
E2E-02	A shipment in trouble (HS code mismatch), put on hold, fixed and recovered (SJ-2026-00065).
E2E-03	A surprise charge on a delivered job, then absorbed and handed to Finance (SJ-2026-00070).
E2E-04	A job short on funds, then covered (SJ-2026-00120).
E2E-05	A damaged delivery blocks the handoff to Finance (SJ-2026-00077).
E2E-06	A person leaves, and their work is handed to a colleague.

When are we done?

The proposed acceptance rule: **all Critical and Major cases pass, there are no open Critical defects, and every Minor defect has an owner.** The Summary sheet shows these numbers live. At the end, each tester fills their line in the sign-off table on the Read me sheet.

Quick checklist before you start

- ☐ I have read Sections 1 to 6 of this guide (about 15 minutes).
- ☐ I can open apps/mockup/index.html in Chrome or Edge and see the sign-in screen.
- ☐ I have the UAT-test-cases.xlsx workbook open, on the Test Cases sheet.
- ☐ I know my role, my section, and I pressed F5 to start with fresh data.
- ☐ I will log every failure in the Defects sheet, with a screenshot.

Questions while testing? Write them in the Notes column and raise them together in the next sync.
